AB - PURPOSE: To restrain discharge speeds from fluctuating in e discharge process to a great extent by setting a syringe pump vertically, and thereby forming a gas layer between the front face of a piston and fluid surface.
- CONSTITUTION: A syringe pump is set vertically, and gas (air) A is sealed in a gap between the front surface of a piston 2 and fluid surface. In the second place, in the process of discharging fluid L, a cylinder 1 is lifted by a lifting means, the state of fluid surface is fixed at the time of discharge. By this constitution, discharging speeds are restrained from being fluctuated to a great extent in the process of discharge, the occurrence of fluctuation can thereby be prevented even with no accumulator furnished.
